0.8–4.7	μg/dL	Normal			
2.3–4.7	μg/dL	Grey zone in old or symptomatic cats			
>4.7	μg/dL	Consistent with hyperthyroidism			

Cats with subnormal T₄ values are almost exclusively euthyroid sick or over treated for their hyperthyroidism. Older cats with consistent clinical signs and T₄ values in the grey zone may have early hyperthyroidism or a concurrent non-thyroidal illness. Hyperthyroidism may be confirmed in these cats by adding on a free T₄ (fT₄) or by performing a T₃ suppression test. Following treatment with methimazole, T₄ values will generally fall within the lower to middle end of the reference range.
